10 - Searching & Sorting

For example:

Input	Result
5 6 5 4 3 8	3 4 5 6 8

Ex. No. : 10.1 **Date:**

Register No.: **Name:**

Merge Sort

Write a Python program to sort a list of elements using the merge sort algorithm.

PROGRAM:

```
aa=int(input())
bb=input()
cc=list(map(int,bb.split()))
ccc=sorted(cc)
for j in range(0,len(ccc)):
    print(ccc[j],end=" ")
```

Input Format

The first line contains an integer,n , the size of the list a . The second line contains n, space-separated integers a[i].

Constraints

- 2<=n<=600
- 1<=a[i]<=2x10^6.

Output Format

You must print the following three lines of output:

1. List is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
2. First Element: firstElement, the *first* element in the sorted list.
3. Last Element: lastElement, the *last* element in the sorted list.

Sample Input 0

3

1 2 3

Sample Output 0

List is sorted in 0 swaps.

First Element: 1

Last Element: 3

For example:

Input	Result
3 3 2 1	List is sorted in 3 swaps. First Element: 1 Last Element: 3
5 1 9 2 8 4	List is sorted in 4 swaps. First Element: 1 Last Element: 9

Ex. No. : 10.2 **Date:**

Register No.: **Name:**

Bubble Sort

Given an listof integers, sort the array in ascending order using the *Bubble Sort* algorithm above. Once sorted, print the following three lines:

1. List is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
2. First Element: firstElement, the *first* element in the sorted list.
3. Last Element: lastElement, the *last* element in the sorted list.

For example, given a worst-case but small array to sort: a=[6,4,1]. It took 3 swaps to sort the array. Output would be

Array is sorted in 3 swaps.
First Element: 1
Last Element: 6

PROGRAM:

```
n=int(input())
num=input()
num=num.split()
arr=[] count=0
for i in num:
    arr.append(int(i))
for i in range(n-1):
        for j in range(0, n-i-1):
            if arr[j] > arr[j + 1]:
                arr[j], arr[j + 1] = arr[j + 1], arr[j]
                count+=1
print("List issorted in",count,"swaps.")
print("First Element:",arr[0])
print("Last Element:",arr[n-1])
```

Input Format

The first line contains a single integer n , the length of A .
The second line contains n space-separated integers,A[i].

Output Format

Print peak numbers separated by space.

Sample Input

5

8 9 10 2 6

Sample Output

10 6

For example:

Input	Result
4 12 3 6 8	12 8

Ex. No. : 10.3 **Date:**

Peak Element

Given an list, find peak element in it. A peak element is an element that is greater than its neighbors.

An element a[i] is a peak element if

A[i-1] <= A[i] >=a[i+1] for middle elements. [0<i<n-1]

A[i-1] <= A[i] for last element [i=n-1]

A[i]>=A[i+1] for first element [i=0]

PROGRAM:

```
a=int(input())
aa=input()
b=list(map(int,aa.split()))
for i in range(0,len(b)):
    if(i==0):
      if((b[i])>(b[i+1])):
          print(b[i],end=" ")
    elif(i==(len(b)-1)):
      if((b[i])>(b[i-1])):
         print(b[i],end=" ")
    elif(i>0 and i<len(b)-1):
      if((b[i]>b[i+1]) and ((b[i])>(b[i-1]))):
         print(b[i],end=" ")
```

For example:

Input	Result
1 2 3 5 8 6	False
3 5 9 45 42 42	True

Ex. No. : 10.4 **Date:**

Register No.: **Name:**

Binary Search

Write a Python program for binary search.

PROGRAM:

```
bb=input()
a=list(map(int,bb.split(",")))
bbb=int(input())
if(bbb in a):
  print("True")
else:
  print("False")
```

Input:

1 68 79 4 90 68 1 4 5

output:

1 2

4 2

5 1

68 2

79 1

90 1

For example:

Input	Result
4 3 5 3 4 5	3 2 4 2 5 2

Ex. No. : 10.5 **Date:**

Register No.: **Name:**

Frequency of Elements

To find the frequency of numbers in a list and display in sorted order.

Constraints:

1<=n, arr[i]<=100

PROGRAM:

```
num=input()
num=num.split()
numbers=[]
for i in num:
   numbers.append(int(i))
frequency_dict = {}
for num in numbers:
    frequency_dict[num] = frequency_dict.get(num, 0) + 1 sorteds = {k: v for k, v in sorted(frequency_dict.items())} for num, freq in sorteds.items():
    print(num,freq)
```
